PHOTOTHERAPY

Phototherapy is a safe and highly effective treatment for such skin diseases as psoriasis, eczema, and vitiligo, as well as many others. It can take place in a clinical setting or be prescribed for use in the patient's home. For best results, phototherapy treatments need to occur about three times a week for several weeks to months depending on the disease. Home phototherapy is popular because it is easy for patients to maintain consistency in their treatment service.

Contrary to other therapies, phototherapy can be prescribed for many types of patients. Pregnant women, children, elderly, those with compromised immune systems can all benefit from this safe & effective treatment. Side effects are mild and temporary. Examples of side effects are dry skin, itching or occasional erythema.

The program is provided to you at a substantial discount - in some cases at NO COST!

1-800-322-8546

Most phototherapy performed today uses Narrowband UVB. This is the most therapeutic band of light and treatments are quite brief, typically just seconds to minutes in duration. Patients simply expose the affected skin to the light - there is no need for other drugs or medication. Once the treatment is over, patients go about their day as normal.
